

Problem 3. Find the orthogonal projection of vector $\mathbf{a} = (1, 2, -4, 2)^T$ on the subspace of R^4 spanned by the vectors $\mathbf{v}_1 = (1, 2, 1, 2)^T$ and $\mathbf{v}_2 = (1, 0, 1, -1)^T$.

Let $\hat{\mathbf{a}} \in \text{span}\{\bar{\mathbf{v}}_1, \bar{\mathbf{v}}_2\}$ be the orthogonal projection of vector $\bar{\mathbf{a}}$ on $W = \text{span}\{\bar{\mathbf{v}}_1, \bar{\mathbf{v}}_2\}$.

$$\hat{\mathbf{a}} = \frac{\bar{\mathbf{a}} \cdot \bar{\mathbf{v}}_1}{\|\bar{\mathbf{v}}_1\|^2} \bar{\mathbf{v}}_1 + \frac{\bar{\mathbf{a}} \cdot \bar{\mathbf{v}}_2}{\|\bar{\mathbf{v}}_2\|^2} \bar{\mathbf{v}}_2 \quad \text{if } \bar{\mathbf{v}}_1 \perp \bar{\mathbf{v}}_2. \quad \text{Note } \bar{\mathbf{v}}_1 \cdot \bar{\mathbf{v}}_2 = 1 + 1 - 2 = 0. \\ \Rightarrow \bar{\mathbf{v}}_1 \perp \bar{\mathbf{v}}_2.$$

$$\bar{\mathbf{a}} \cdot \bar{\mathbf{v}}_1 = \begin{pmatrix} 1 \\ 2 \\ -4 \\ 2 \end{pmatrix} \cdot \begin{pmatrix} 1 \\ 2 \\ 1 \\ 2 \end{pmatrix} = 1 + 4 - 4 + 4 = 5$$

$$\|\bar{\mathbf{v}}_1\|^2 = 1 + 4 + 1 + 4 = 10$$

$$\bar{\mathbf{a}} \cdot \bar{\mathbf{v}}_2 = \begin{pmatrix} 1 \\ 2 \\ -4 \\ 2 \end{pmatrix} \cdot \begin{pmatrix} 1 \\ 0 \\ 1 \\ -1 \end{pmatrix} = 1 - 4 - 2 = -5$$

$$\|\bar{\mathbf{v}}_2\|^2 = 1 + 1 + 1 = 3$$

$$\hat{\mathbf{a}} = \frac{5}{10} \bar{\mathbf{v}}_1 - \frac{5}{3} \bar{\mathbf{v}}_2 = \frac{5}{30} (3\bar{\mathbf{v}}_1 - 10\bar{\mathbf{v}}_2) = \\ = \frac{1}{6} \begin{pmatrix} 3 & -10 \\ 6 & 0 \\ 3 & -10 \\ 6 & 10 \end{pmatrix} = \frac{1}{6} \begin{pmatrix} -7 \\ 6 \\ -7 \\ 16 \end{pmatrix} = \begin{pmatrix} -7/6 \\ 1 \\ -7/6 \\ 8/3 \end{pmatrix}.$$
