

---

# Tutorial 2: Building a model

---

## Introduction

This tutorial builds a Black Oil model from scratch using output generated by other SIS Simulation Software applications. It focuses on manipulation in each section in the **Data Manager**, but includes the submission of the simulation run, and viewing errors or warnings.

This tutorial takes about thirty-five minutes to complete.

---

## Stages

- ["Model definition: data input" on page 46](#)
- ["PVT section: fluid definitions" on page 51](#)
- ["SCAL section: saturation definitions" on page 53](#)
- ["Initialization section" on page 54](#)
- ["Schedule section: production schedule" on page 56](#)
- ["Summary section" on page 56](#)
- ["Run manager" on page 57](#)
- ["Report generator" on page 58](#)

---

## Problem description

The example simulates the production life of an oil reservoir, 5000m by 5000m and 60m thick. The reservoir fluid consists of live oil and gas, with an aquifer of uncertain volume. The second layer has numerous shale components, introducing a lower permeability in this layer. The reservoir is subdivided into a 10x10x4 grid, and history matching concentrates on determining the aquifer contribution to total energy.

---

## Data preparation

- 1 Create a working directory in a convenient place.
- 2 Copy all datafiles from the `Tutorial 2` directory, normally residing on `/ecl/2007.1/office/tutorials/example2`, to the current working directory.

---

## Open new project

- 1 To begin, start ECLIPSE Office.
- 2 Select **File | New Project**.
- 3 Call the project `Build1`.

- 4 Select File | Save Project to save the project file to disk.
- 5 In the main ECLIPSE Office panel, choose View | Display Model in DM
- 6 In the main ECLIPSE Office panel, choose View | Display Model in Grid Section

---

## Model definition: data input

- 1 Click on Data to activate the Data Manager Module (DMM).
- 2 Select Case Definition.
- 3 Activate the following options:

Simulator	Black Oil
Title	Tutorial 2: Workflow
Simulation Start Date	1 Jan 1990
Model dimension (x,y,z)	10, 10, 4
Units	Metric
Run Type	Normal

- 4 Select the Reservoir tab.
- 5 Activate Aquifers and select Analytical
- 6 Grid Option: Cartesian
- 7 Geometry Option: CornerPoint
- 8 Select the PVT tab
- 9 Activate Water, Oil, Gas, Dissolved Gas.

---

**Hint** The Dissolved Gas option is only active if the OIL option has been selected.

---

---

**Hint** Input and output file formats are selected on the Run Manager panel, as well as the NOSIM option to initialize the model and perform data checking.

---

- 10 Select the Misc tab
- 11 Change the Stack size of previous search directions (NSTACK) to 50
- 12 Accept the defaults for the remaining input parameters.
- 13 Click on OK to store the changes and exit.
- 14 Select File | Save Project from the main project panel to save the Case Definition Section.

## Geological definition of model and grid building

- 1 Select Data Manager: Grid to open the grid definition section, where the geological properties are defined.
- 2 Select Grid Section: File | Import File | New... and import the GRID1 .GEC file by selecting the file from the browser.

---

**Note** If the file contains the `SPECGRID` keyword then it is not necessary to specify the dimensions in the **Case Definition Section**, as ECLIPSE Office inserts the grid size it reads from the keyword. The `SPECGRID` keyword must appear before any array-based keywords.

---

- 3 Select Grid Section: File | Save As...
- 4 Check that the Directory for all the GRID Section Files: entry matches the selection you wish.
- 5 Accept the default root name, which should be `Build1`.
- 6 Click on the **Advanced...** button. The `GRID` header, geometry and parallel/operational `INCLUDE` files are saved. The Properties and Other `INCLUDE` files are not saved yet as they contain no keywords.
- 7 Click on **Save**.
- 8 Select Grid Section: Subsection | Grid Keywords.
- 9 Check that the data for the keywords `COORD` and `ZCORN` have been inserted correctly.

---

**Hint** Select Grid Keywords: View | Keywords to show the keyword names.

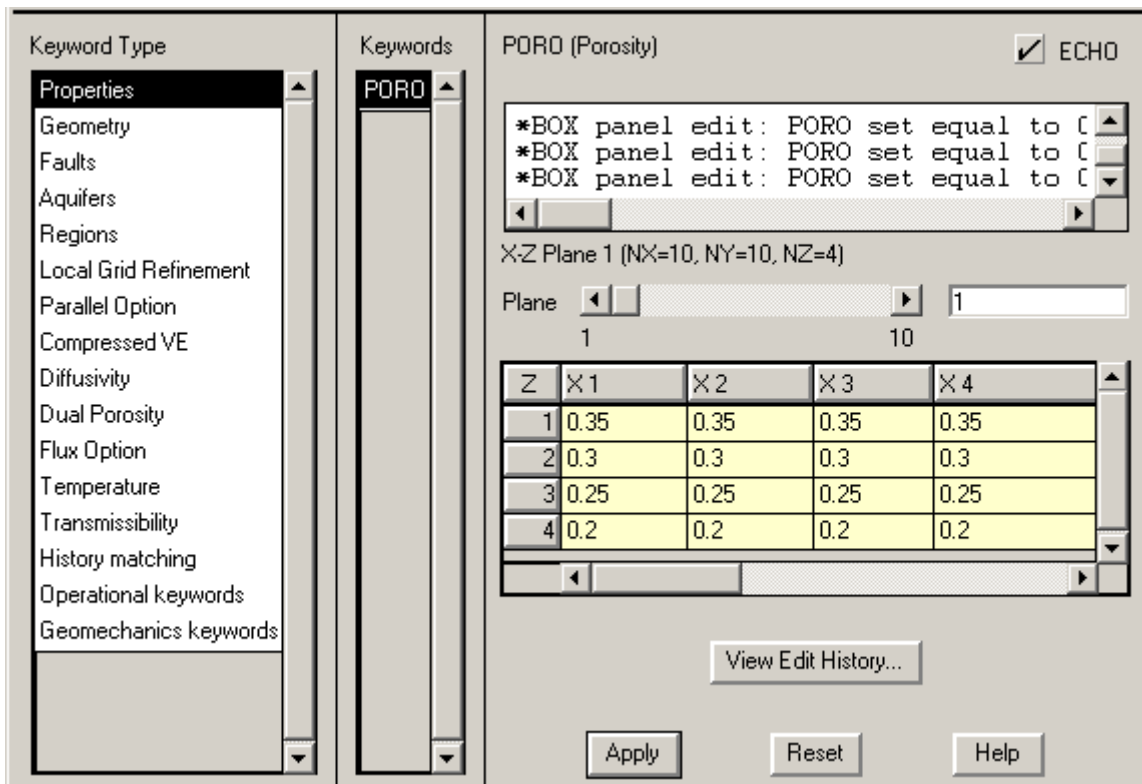

---

- 10 Select **Properties** from the **Keyword Type** list to insert porosity and permeability.
- 11 Select Grid Keyword Section: Edit | Insert Keyword, and from the list of keywords, select `PORO`.
- 12 Select Grid Keyword Section: Edit | Box to display the Array Box Selection panel.

### Setting the porosity in the horizontal plane

- 1 Change the K-value range to be from 1 to 1, and enter `.35` into the **Data Value** box. Make sure that the **Operation** is set to **Equals**.
- 2 Click on **Apply**.
- 3 Repeat this action for the other 3 planes, with porosity values of `.3`, `.25` and `.2` for each of `K = 2, 3` and `4`, respectively.
- 4 Click on **Array Box Selection: Close**.
- 5 Select Grid Keyword Section: View | Grid Order | XZ-plane to see the following screen ([Figure 4.7](#)).

Figure 4.7 DMM - GRID Keyword section

- 6 Select View Edit History... in the PORO panel to display a table containing the edits which have been applied to the current keyword.
- 7 Select any row in the Edit History panel to display comments for a particular edit.

---

**Note** Comments which have been automatically added by Office are preceded with a “\*”. You can use this panel to edit the comments.

---

- 8 Select Cancel to close the Edit History panel.
- 9 To insert the permeability data, Grid Keywords Section: Edit | Insert Keyword, and from the list of keywords, select PERMX. The table for data input is displayed.
- 10 Select Grid Keyword Section: Edit | Box to display the Array Box Selection panel.

### Setting permeability per plane

- 1 Change the K-value range to be from 1 to 1.
- 2 Enter 1 into the Data Value box, and select D for Darcy from the Unit dropdown-list.
- 3 Make sure that the Operation is set to Equals.
- 4 Click on Apply.

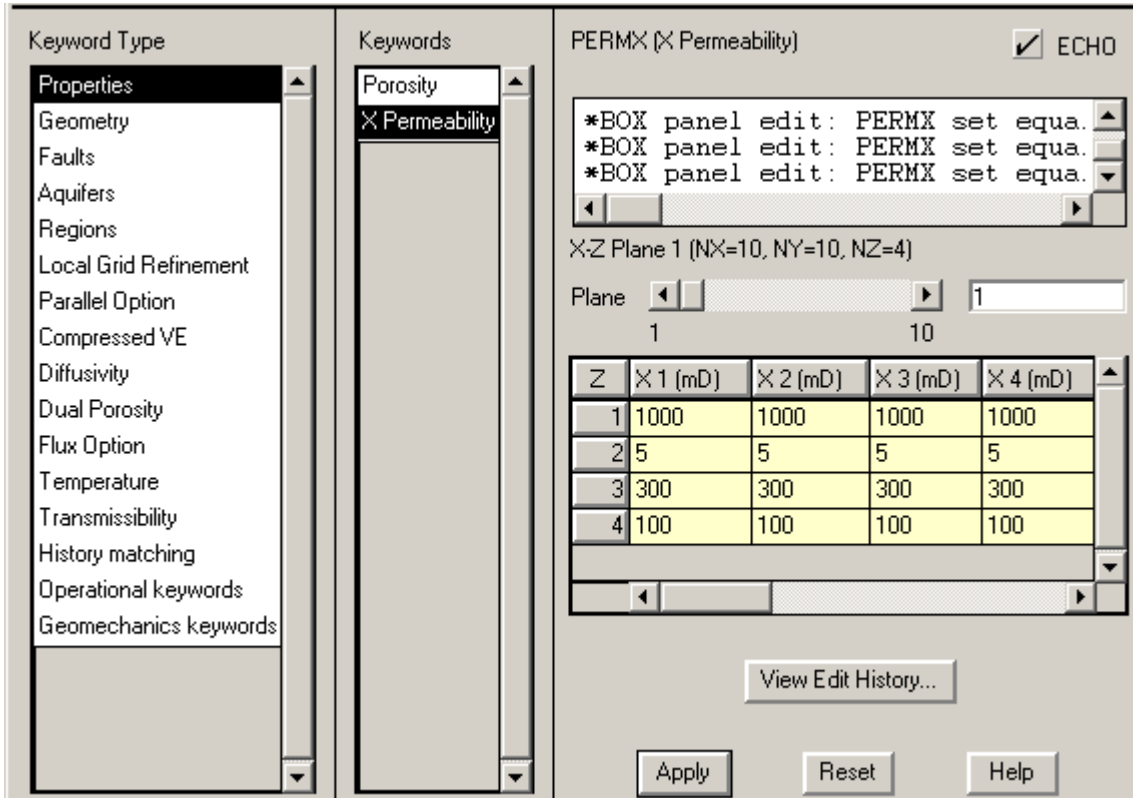

---

**Note** The data is converted to the correct unit as needed for the simulator, based on the selection of model units in the Case Definition Section - in this case, METRIC - when the data is saved to disk.

---

- Repeat this action for the remaining 3 planes, with permeability values of .005 D, .3 D and .1 D, for each of K = 2, 3 and 4, respectively. Data should appear as in [Figure 4.8](#).

**Figure 4.8** Data Manager module Grid Keyword Section

- Use option Grid Keyword Section: Edit | Insert Keyword to display the Keyword Selection box. Select PERMY and PERMZ from the list.
- Click on Properties in the Keyword Types list if it is not active already. This lists the current property keywords in the model.
- Select PERMY from the list of keywords.
- Select Edit | Box from the menubar.

### Setting PERMY to equal PERMX

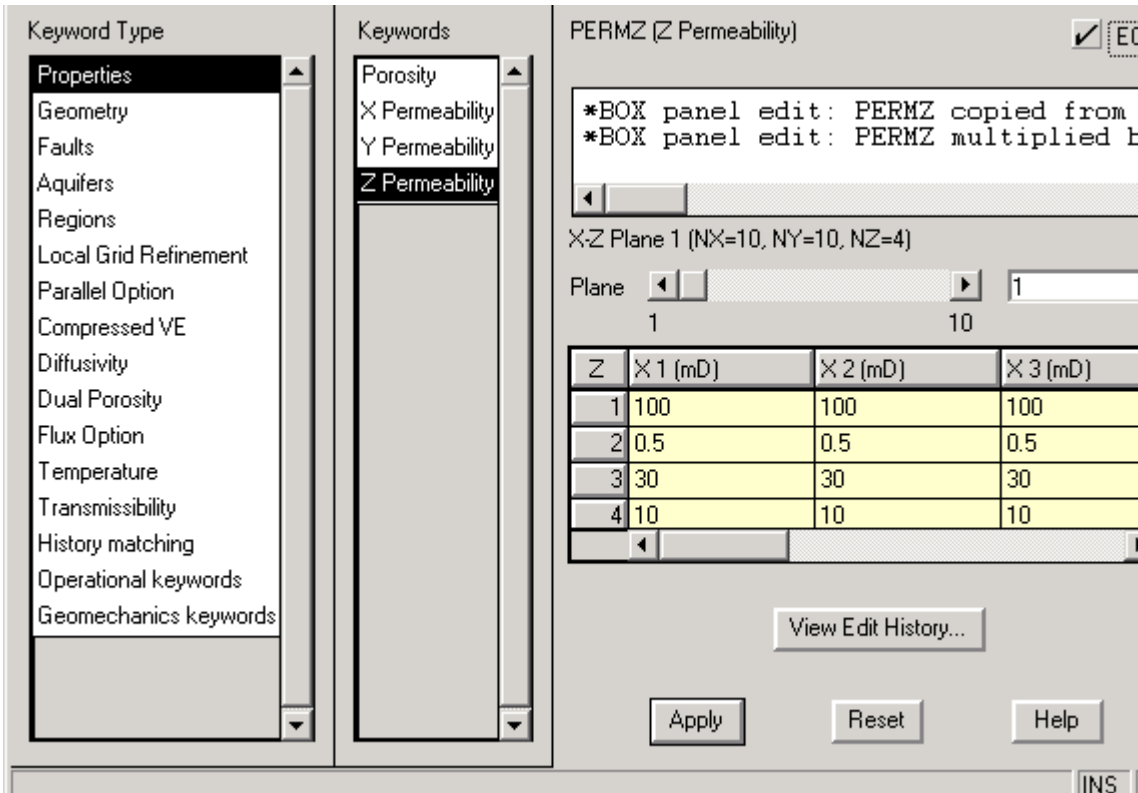

- Select COPY on the Operation drop-down list.
- Select PERMX from the Copy from drop-down list.
- Leave the I,J,K ranges at their default values.
- Click on Apply to perform the operation.

### Setting PERMZ equal to .1\*PERMX:

- Click on the PERMZ keyword in the Keyword list, to activate it.
- Repeat the Box | COPY operation to copy PERMX into PERMZ .
- For the next action, select Multiply as the Operation, Multiplier=.1.
- Close the Array Box Selection edit panel.

The results should be the same as in [Figure 4.9](#).

Figure 4.9 Grid Section keywords

- 5 Select View Edit History... to display a panel containing **all** edits which have been applied to property keywords.

---

**Note** Edit | Delete Edit History consolidates all the edits into a single keyword. This is identical to the pre-2002A behavior.

---

A GRID file is required by all sections in order to display region and property data during the model building phase of the project. It can be recognized by the file name extension .GRID or .EGRID for an unformatted or binary file, and .FGRID or .FEGRID for an ASCII or formatted file. The output format is selected on the main Run Manager panel.

- 6 To ensure that a GRID file is written as part of the output, select Operational Keywords from the Keyword Types list.
- 7 Confirm that the GRIDFILE keyword is in this list.

---

**Note** ECLIPSE Office writes GRIDFILE 2 to the \_geom.inc file in all cases to ensure that all data required in the Result Viewer is available.

---

- 8 Select GRID Keyword Section: Edit | Insert Keyword.
- 9 From the same list, insert INIT to write the file containing initial properties of the grid. File extension .INIT or .FINIT.
- 10 Click on Apply.
- 11 Click on File | Close to exit the Grid Keywords panel.
- 12 Select Grid Section: File | Save... and save the geometrical data.

- 13 Select Grid Section: GridView | From Keywords to generate a gridfile for 2D and 3D viewing.
- 14 Select YES to create the GRIDFILE.
- 15 Select Grid Section: GridView | 3D to see the 3D image of the simulation grid.
- 16 Close the 3D Viewer with File | Close.
- 17 Select Grid Section: File | Close to exit.

---

## PVT section: fluid definitions

- 1 Select Data Manager: PVT to insert the PVT data.
- 2 Select File | Import | New... and insert the data from the `pvt2.pvo` file.
- 3 Select PVT Section: File | Save As, and use the default filename to save the data imported from the file to the `Build1_pvt.inc` file.
- 4 Update the project file at the same time, by selecting the Update Current Case and Save Project File options on the File Save As panel.

---

**Hint** Update Current Case updates the main ECLIPSE Office Case Manager panel with the link to the PVT data, and commits the data internally.  
Save Project File saves the project data, with the link, to the main `Build1.OFF` file on disk.

---

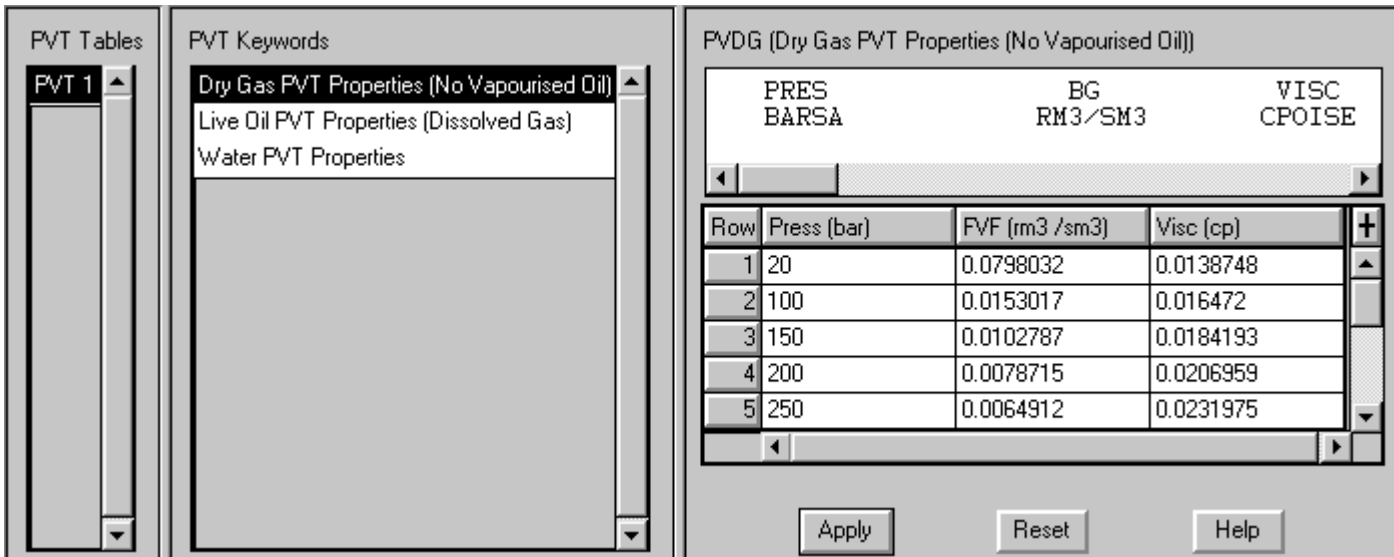

- 5 Select PVT Section: Section | Keywords from the menubar.
- 6 Select from the menubar PVT Keywords: Keyword Types | PVT Tables. This may be active already.
- 7 Observe the data inserted from the imports as in [Figure 4.10](#):
  - a PVDG, which contains the Dry Gas fluid properties,
  - b PVTO with the Oil properties, and
  - c PVTW the water properties.
  - d Only one PVT region has been specified: PVT1.

---

**Hint** Menu option PVT Keywords: View | Keywords displays keyword names.

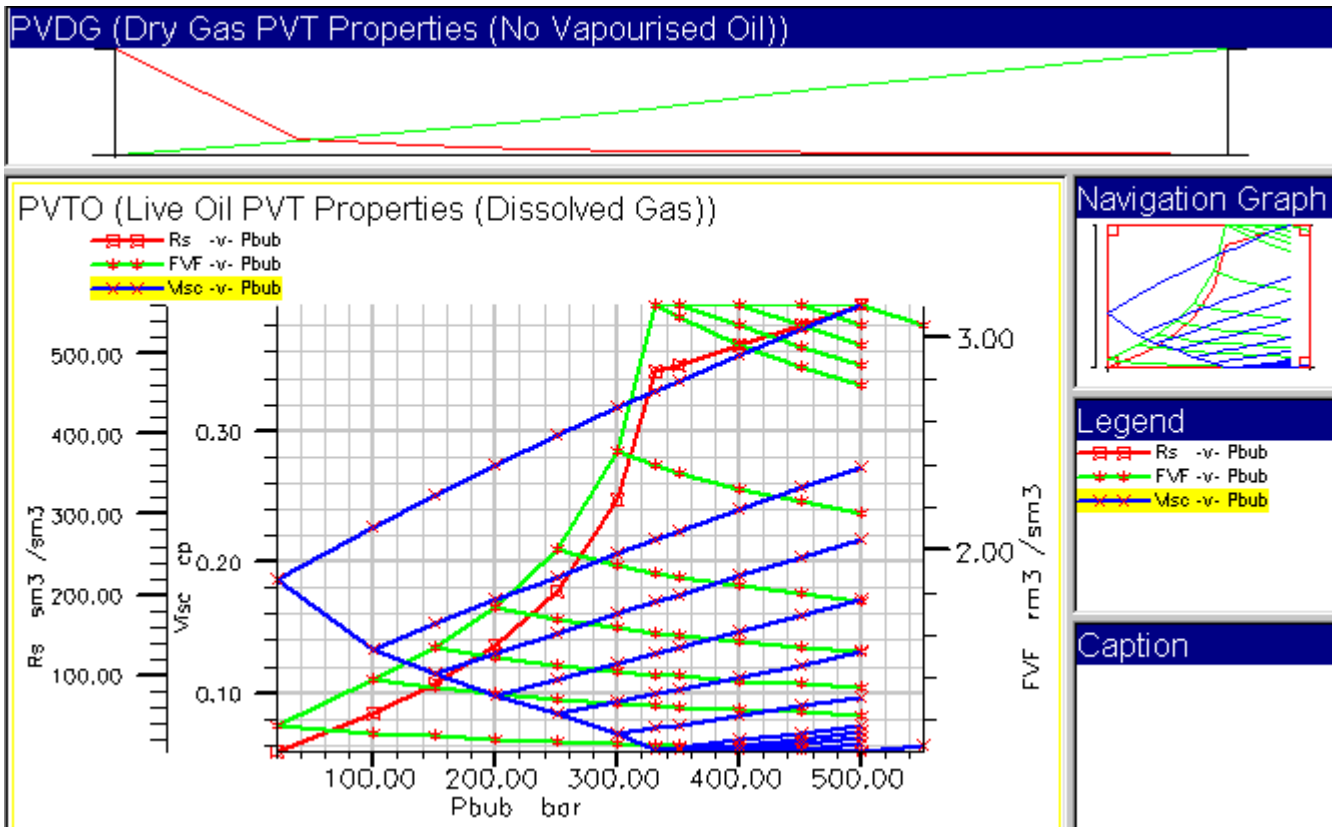

---

**Figure 4.10** DMM - PVT keywords

- 8 Select PVT Keywords: View | Plot to view the data graphically. This shows both Oil and Gas properties.
- 9 Double-click on the top section workspace to toggle between the two graphs.

**Figure 4.11** PVDG and PVTO properties for the BUILD1\_E100 model

- 10 Select File | Close to return to the PVT Keywords panel.
- 11 Select PVT Keywords: Edit | Insert keyword

12 Select DENSITY from the list of Keywords.

13 Insert the following values:

Oil density	749.389 kg/m <sup>3</sup>
Water density	1000 kg/m <sup>3</sup>
Gas density	1.11242 kg/m <sup>3</sup>

14 Click on Apply to commit the data.

15 Select Edit | Explore keyword|Toggle Desc/Keys and then select the ROCK keyword.

16 Enter:

Reference pressure	400 bar
Rock compressibility	4.0E-5 /bar.

17 Click on Apply to commit the data.

18 Select PVT Keywords: Keyword Types | Miscellaneous from the menu bar.

19 Select Edit | Explore keyword|Toggle Desc/Keys and then select the RPTPROPS keyword.

20 Switch on the outputs of Oil PVT tables and Gas PVT tables.

21 Click on Apply to commit.

22 Select File | Close to exit from the PVT Keywords section.

23 Select PVT Section: File | Save to save the data to the same file that initial save was done.

---

**Note** If any regions have been specified using PVTNUM, the Region File Save panel appears, to allow these to be written to the Build1\_reg.inc file.

---

24 Select PVT: File | Close to exit.

---

## SCAL section: saturation definitions

### SCAL keywords

1 Select Data Manager: SCAL.

2 Select File | Import | New... and read the saturation keyword file scal2.rcp.

---

**Hint** Change the File Browser filter to search for \*.rcp if required

---

3 Select SCAL Section: Section | Keywords.

4 Use SCAL Keywords: View | Plot to graphically view the Saturation versus Relative Permeability curves.

Values may be changed in the table until the graphs are more acceptable. The graph is updated automatically when you click on the Apply button.

5 Select File | Close to close the Graph panel.

- 6 To return to the main SCAL Section panel, select SCAL Keywords: File | Close
- 7 Select SCAL Section: File | Save As... to save the data to disk, as well as the project. This section is saved to Build1\_scal.inc.
- 8 Accept the default filename.
- 9 Select SCAL Section: File | Close to exit.

---

## Initialization section

- 1 Select Data Manager: Initialization.
- 2 Select Initialization Section: Edit | Insert Keyword.
- 3 Select EQUIL to specify the initial equilibration conditions.
- 4 Insert the following data for EQUIL:

Datum depth	3000 m
Pressure at datum depth	331.65 bar
WOC depth (Oil-Water contact depth)	3085 m
OW Cap Pressure (Oil-water Pc at OWC)	0 bar
GOC (Depth of Gas contact)	3000 m
GO Cap Pressure (Gas-Oil Pc at GOC)	0 bar
RS/Pb v Depth table number	1
Rv/Pd v Depth table number	1

To indicate that the default value should be used in the simulation, the data field should be left empty, in which case ECLIPSE Office writes “1\*” as a placeholder in the file.

Leave the Accuracy field empty, so that the default value is used in the simulator.

- 5 Click on Apply to commit the data.
- 6 Insert the RSVD keyword.
- 7 Insert data for RSVD, using the TAB key to move between columns, and the + symbol on the top right corner of the table to add a row.

3000m	477.91 sm <sup>3</sup> /sm <sup>3</sup>
4000m	486.6 sm <sup>3</sup> /sm <sup>3</sup>

- 8 Click on Apply.

## Aquifer data

- 1 Select Initialization Section: Keyword Types | Aquifer to display aquifer related keywords.
- 2 Select Initialization Section: Edit | Insert Keyword.
- 3 Click on AQUIFETP to define the general aquifer parameters for a Fetkovich aquifer, and AQUANCON to define the aquifer connections with the reservoir.
- 4 Click on Fetkovich Aquifer and insert data for AQUIFETP :

---

**Note** To change the unit of a column, click on the column with the right-mouse-button and select **Change Units** from the menu displayed. The **Initialization: Aquifer Connections** panel appears on which pressure units kPa can be selected from the drop-down lists. **Save to disk** converts the units as needed.

---

5 Enter the following data:

Id of Aquifer	1
Datum depth	3113.2 m
Initial Aquifer Pressure	337.582 bar
Initial Aquifer Volume	18.0E9 m3
Total Compressibility (Rock + Water)	5.0 E-5 /kPa
Aquifer Productivity Index	500 sm3/day/bar
PVT Water Property Table	1

6 Leave the **Salt Water Concentration** field empty.

7 Click on **Apply** to commit.

---

**Hint** Table edit functions are displayed when the right mouse button is pressed with the cursor on the table.

---

8 Insert data the following data for **AQUANCON**, using the **TAB** key to move between columns. Click on the + sign on the top right corner of the table with the cursor in last column to add a row.

The connection face (J/I) is selected from a dropdown list that becomes active once you click in the cell.

Aquifer ID	Lower I Con	Upper I Con	Lower J Con	Upper J Con	Lower K Con	Upper K Con	Connection Face
1	1	10	1	1	4	4	J-
1	1	10	10	10	4	4	J+
1	1	1	1	10	4	4	I-
1	10	10	1	10	4	4	I+

9 Click on **Apply** to commit the data.

## Inserting keywords

- 1 Select **Initialization Section: Keyword Types | Miscellaneous** and then **Edit | Insert Keyword** to insert keyword **RPTSOL**.
- 2 Check the parameters:
  - a **Grid Block Pressures, Oil, Water and Gas Saturations**
  - b **Restarts/Initial Restart and Fluid In Place Reports with Balance Sheet.**
- 3 Click on **Apply** to commit the options.
- 4 Use **File | Save As...** to write the data to the file **Build1\_INIT.INC** and update the project with the section.

- 5 Select **Initialize Model | Run Simulation**. This runs the simulator to the first time step. An initial restart file is created which contains details of grid block pressure and saturations at the beginning of the run.
- 6 Select **Initialize Model | FIP Report** to see initial fluids in place. Select this option again to return to the keywords.

---

**Note** If more than one Fluid-In-Place region has been defined using FIPNUM, then the panel will contain data on a region-by-region basis as well as at field level.

---

- 7 Select **Initialization Section: File | Close** to exit from the Initialization Section.

---

## Schedule section: production schedule

- 1 Select **Schedule** from the Data Manager list.
- 2 Use the **Schedule Section: File | Import | New...** to import the file `sched2`. All initial well specifications, well completion and well controls are specified in this file.

---

**Hint** Change the File Browser filter to `*.sch`, if required, to make it visible in the browser window.

---

- 3 Use **File | Import | Append...** to add the history data from the file `wconhist`.

---

**Note** Ignore the warning that the `SCHEDULE` keyword does not exist, and continue.

---

- 4 Select **File | Save As...** to save the data to the default ECLIPSE Office file `Build1_SCH.INC`. Update the project with the data at the same time.
- 5 Click on each time/date to see the events connected to it.
- 6 Toggle between keywords and descriptions of events using **View | Description** and **View | Keyword**.
- 7 Select **Schedule Section: File | Close** to close the section.

---

**Note** If the Generic Keywords option is ON in the Dimension Overrides section:

1. In **Data Manager > Section > Dimension Overrides**, select **Keyword Well Dimensions**.
2. Change the 4 dimensions to 4, 3, 2, and 5 respectively. Click on **Apply** and close the **Dimension Overrides Section**.

---

---

## Summary section

- 1 Select **Data Manager: Summary**

Summary variables contain vector data, such as well production rates, for each report step, and are saved in the `.Snnnn` files during the simulation run.

- 2 Select **Summary Section: File | Import | New...** to import the summary vectors from the file `summary.dat`.

- 3 Click on the **Selected** button to see the vectors which have been loaded.

## Adding summary vectors

- 1 Click on the **Keywords** button to return to the panel where new output mnemonics may be added.
- 2 Select the **Field** tab on the **Summary Section** panel
- 3 Select **others** from the **Phases** list, and **Pressure** from the **Types** list. **FPR** will be listed in the **Keyword** selection box.
- 4 Click on **FPR** in the **Keywords** list to make it active.
- 5 Click on **Add to List** to add this keyword to the selected list of summary vectors.

## Producing bottomhole pressures for all wells

- 1 Select the **Well** tab.
- 2 Select **others** from the **Phases** list, and **Pressure** from the **Types** list.
- 3 Select **WBHP** from the **Keyword** list.
- 4 Select **All wells** in the **Wells** list.
- 5 Click on **Add to List** to insert the keyword into the selected list.
- 6 Use **Summary Section: File | Save As...** to save the list to the project and the summary include file `Build1_SUM.INC`, on disk.
- 7 **Summary Section: File | Close** closes the **Summary Section** and returns you to the main **Data Manager** panel.
- 8 Select **Data Manager: File | Close** to return to the main **ECLIPSE Office** project panel.

---

## Run manager

- 1 Click on **Run** on the main **ECLIPSE Office** panel to activate the **Run Manager**.
- 2 Select **Run Manager: Submit | Runs** to submit the simulation run. 

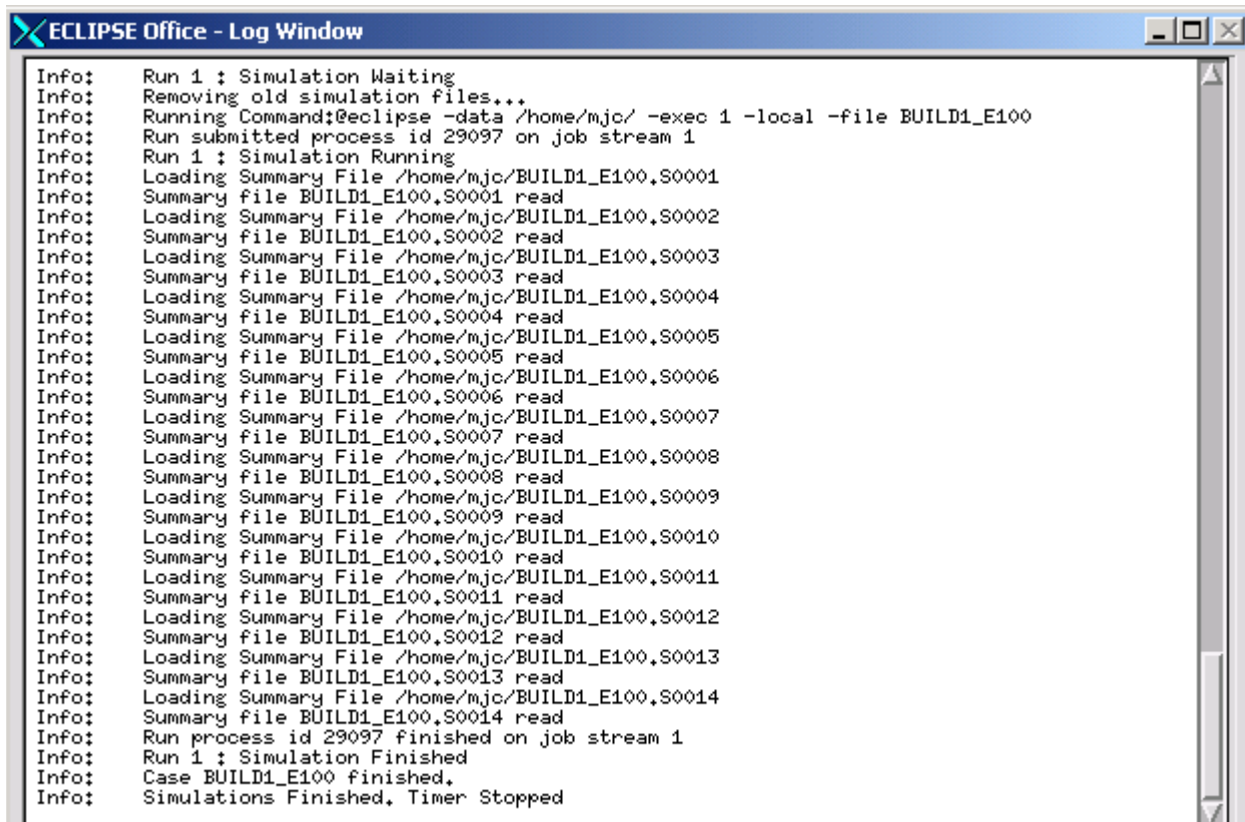

---

**Hint** If a run has been attempted on a previous occasion with the same project, the file `Build1_E100.DATA` might exist. In such a case the program gives you the opportunity to either use the previous data file, or overwrite it with the current data. Choose the **YES** option to overwrite the existing file.

---

- 3 Check the **Log** window to check if submission was successful and to monitor the progress of the files written to disk at each reportstep. (See [Figure 4.12](#)).

```

- 4 Select Run Manager: Monitor | Control Simulations  for information about the current run. This option is only activated once the simulation started.
- 5 Check the Log window for messages about the simulation.
- 6 Select Run Manager: File | Close once the simulation run is finished.

---

## Report generator

- 1 Click on Report on the main ECLIPSE Office project panel, to activate the Report Generator.
- 2 Select Report Generator: File | Open Current Case | PRT... to open the PRT file created by the simulation run.

---

**Note** The BUILD1\_E100.PRT file contains all output requested by the PRT\* keywords selected in each data section of the data model; as well as a report on the errors or problems found during the simulation run.

---

- 3 Select Errors... from the Report drop-down.

---

**Note** It is sometimes useful to look at the complete .PRT file in order to resolve errors with regard to erroneous data in keyword arguments. In the .PRT file the error is generally directly after the keyword involved. The **Util | Text Editor** can be used at any point in time to view this file.

---

4 Tick **ERRORS** and **WARNINGS** then click on **Generate Report**.

If there are no errors, the **ERRORS** option is not available for selection.

---

**Note** If errors appear with a **Simulation Failed** message in the **Log** window, the errors listed in the report have to be resolved in the **Data Manager** before attempting a simulation run again.

---

5 Select **Output** to see the report.

6 Exit from the **Report Generator** module with the **File | Close** option.

7 Save the project on the main **ECLIPSE Office** project panel, using the menu option **File | Save Project**.

---

**Note** See "[Report Generator](#)" on page 316 and "[Result Viewer](#)" on page 284 to view the simulation results. "[Tutorial 4: History matching using ECLIPSE Office and SimOpt](#)" on page 86 shows the basic procedure of a History Matching process, using the same model as above.

---

8 Select **File | Exit** to exit.
